Fast and Stable Riemannian Metrics on SPD Manifolds via Cholesky Product Geometry

Ziheng Chen, Yue Song, Xiaojun Wu, Nicu Sebe

Motivation

Applications of Symmetric Positive Definite (SPD) Matrices

Radar Classification

Brooks et al., 2020

Medical

Chakraborty et al., 2020

Brain-Computer Interfaces

Chen et al., 2026

SPD Networks

Huang et al., 2017

- Key point: **fast, simple, and stable** Riemannian metrics

Geometries of SPD Metrics

$$g_P^{\mathrm{AI}}(V,W) = \langle P^{-1}V, WP^{-1}\rangle, \qquad g_P^{\mathrm{LE}}(V,W) = \langle \mathrm{mlog}_{*,P}(V), \mathrm{mlog}_{*,P}(W)\rangle,$$
$$g_P^{\theta\text{-E}}(V,W) = \frac{1}{\theta^2}\langle \mathrm{Pow}_{\theta *,P} V, \mathrm{Pow}_{\theta *,P} W\rangle, \quad g_P^{\mathrm{LC}}(V,W) = \langle \lfloor X\rfloor, \lfloor Y\rfloor\rangle + \langle \mathbb{L}^{-1}\mathbb{X}, \mathbb{L}^{-1}\mathbb{Y}\rangle, \tag{1}$$

$$g_P^{M\text{-BW}}(V,W) = \frac{1}{2}\langle \mathcal{L}_{P,M}(V), W\rangle. \tag{2}$$

- The one based on the Cholesky is fast, simple, and stable.

Product Structure

Cholesky geometries. The Euclidean space of $n \times n$ lower triangular matrices is denoted $\mathcal{L}^n$. Its open subset, whose diagonal elements are all positive, is denoted by $\mathcal{L}^n_{++}$. The Cholesky space $\mathcal{L}^n_{++}$ forms a submanifold of $\mathcal{L}^n$ (Lin, 2019). For a Cholesky matrix $L \in \mathcal{L}^n_{++}$ and tangent vectors $X, Y \in T_L\mathcal{L}^n_{++}$, the Riemannian metric on the Cholesky manifold, referred to as the diagonal log metric, is

$$g_L^{\mathrm{DL}}(X,Y) = \langle \lfloor X\rfloor, \lfloor Y\rfloor\rangle + \langle \mathbb{L}^{-1}\mathbb{X}, \mathbb{L}^{-1}\mathbb{Y}\rangle. \tag{3}$$

LCM is the pullback metric of g^{DL} by the Cholesky decomposition. As shown by Chen et al. (2024d, Thm. III.1.), the diagonal log metric is the pullback metric, by the diagonal log map, of the Euclidean metric over $\mathcal{L}^n$, which rationalizes our nomenclature.

$$\{\mathcal{L}^n_{++}, g^{\mathrm{DL}}\} = \{\mathcal{S}\mathcal{L}^n, g^{\mathrm{E}}\} \times \overbrace{\{\mathbb{R}_{++}, g^{\mathbb{R}_{++}}\} \times \cdots \times \{\mathbb{R}_{++}, g^{\mathbb{R}_{++}}\}}^{n}. \tag{5}$$

- Euclidean off-diagonals + Non-Euclidean diagonals

Overview

Figure 1: Overview of our theoretical framework. Here, L is a Cholesky matrix.

Closed-Form Operators

Operators	Diagonal Log Metric	θ-DPM	$(\theta,\mathbb{M})$-DBWM
$g_L(X,Y)$	$\lfloor X\rfloor + \lfloor Y\rfloor + \langle \mathbb{L}^{-1}\mathbb{X}, \mathbb{L}^{-1}\mathbb{Y}\rangle$	$\langle \lfloor X\rfloor, \lfloor Y\rfloor\rangle + \langle \mathbb{L}^{\theta-1}\mathbb{X}, \mathbb{L}^{\theta-1}\mathbb{Y}\rangle$	$\langle \lfloor X\rfloor, \lfloor Y\rfloor\rangle + \frac{1}{4}\langle \mathbb{L}^{\theta-2}\mathbb{X}, \mathbb{M}^{-1}\mathbb{Y}\rangle$
$\gamma_{(L,X)}(t)$	$\lfloor L\rfloor + t\lfloor X\rfloor + \mathbb{L}\exp(t\mathbb{L}^{-1}\mathbb{X})$	$\lfloor L\rfloor + t\lfloor X\rfloor + \mathbb{L}\left(I + t\theta\mathbb{L}^{-1}\mathbb{X}\right)^{\frac{1}{\theta}}$	$\lfloor L\rfloor + t\lfloor X\rfloor + \mathbb{L}\left(I + t\frac{\theta}{2}\mathbb{L}^{-1}\mathbb{X}\right)^{\frac{2}{\theta}}$
$\mathrm{Log}_L(K)$	$\lfloor K\rfloor - \lfloor L\rfloor + \mathbb{L}\log(\mathbb{L}^{-1}\mathbb{K})$	$\lfloor K\rfloor - \lfloor L\rfloor + \frac{1}{\theta}\mathbb{L}\left[(\mathbb{L}^{-1}\mathbb{K})^{\theta} - I\right]$	$\lfloor K\rfloor - \lfloor L\rfloor + \frac{2}{\theta}\mathbb{L}\left[(\mathbb{L}^{-1}\mathbb{K})^{\frac{\theta}{2}} - I\right]$
$\mathrm{PT}_{L\to K}(X)$	$\lfloor X\rfloor + (\mathbb{L}^{-1}\mathbb{K})\mathbb{X}$	$\lfloor X\rfloor + (\mathbb{L}^{-1}\mathbb{K})^{1-\theta}\mathbb{X}$	$\lfloor X\rfloor + (\mathbb{L}^{-1}\mathbb{K})^{1-\frac{\theta}{2}}\mathbb{X}$

$t \odot L$	$t\lfloor L\rfloor + \mathbb{L}^t$	$t\lfloor L\rfloor + \left(t\mathbb{L}^{\theta} + (1-t)I\right)^{\frac{1}{\theta}}$	$t\lfloor L\rfloor + \left(t\mathbb{L}^{\frac{\theta}{2}} + (1-t)I\right)^{\frac{2}{\theta}}$

SPD

$$\begin{aligned}
&\gamma^{\mathcal{S}}_{(P,V)}(t) = \mathrm{Chol}^{-1}\left(\gamma^{\mathcal{C}}_{(L,\widetilde{V})}(t)\right), && \mathrm{Log}^{\mathcal{S}}_P(Q) = (\mathrm{Chol}_{*,P})^{-1}\left(\mathrm{Log}^{\mathcal{C}}_L(K)\right),\\
&\mathrm{Exp}^{\mathcal{S}}_P(V) = \mathrm{Chol}^{-1}\left(\mathrm{Exp}^{\mathcal{C}}_L\left(\widetilde{V}\right)\right), && \mathrm{PT}^{\mathcal{S}}_{P\to Q}(V) = (\mathrm{Chol}_{*,Q})^{-1}\left(\mathrm{PT}^{\mathcal{C}}_{L\to K}\left(\widetilde{V}\right)\right),\\
&\mathrm{d}^{\mathcal{S}}(P,Q) = \mathrm{d}^{\mathcal{C}}(L,K), && \mathrm{WFM}^{\mathcal{S}}(\{P_i\},\{w_i\}) = \mathrm{Chol}^{-1}\left(\mathrm{WFM}^{\mathcal{C}}(\{L_i\},\{w_i\})\right),\\
&P \oplus^{\mathcal{S}} Q = \mathrm{Chol}^{-1}(L \widetilde{\oplus}^{\mathcal{C}} K), && t \odot^{\mathcal{S}} P = \mathrm{Chol}^{-1}(t \widetilde{\odot}^{\mathcal{C}} L),
\end{aligned} \tag{11}$$

Applications

Classifier

$$\forall k \in \{1,\dots,C\}, \quad p(y=k \mid x) \propto \exp\left(\mathrm{sign}(\langle a_k, x - p_k\rangle)\Vert a_k\Vert\,\mathrm{d}(x, H_{a_k,p_k})\right)$$
$$p(y=k \mid X) \propto \exp\left(\mathrm{sign}(\langle A_k, \mathrm{Log}_{P_k}(X)\rangle_{P_k})\Vert A_k\Vert_{P_k}\,\mathrm{d}(X, H_{A_k,P_k})\right), \quad \forall X \in \mathcal{M}$$

Theorem 5.1. [↓] *Given an input SPD matrix $S \in \mathcal{S}^n_{++}$, the C-class SPD MLRs under θ-PCM and $(\theta,\mathbb{M})$-BWCM are*

$$\theta\text{-PCM}: p(y=k \mid S \in \mathcal{S}^n_{++}) \propto \exp\left[\langle \lfloor K\rfloor - \lfloor L_k\rfloor, \lfloor A_k\rfloor\rangle + \frac{1}{2\theta}\langle \mathbb{K}^{\theta} - \mathbb{L}_k^{\theta}, \mathbb{A}_k\rangle\right], \tag{14}$$

$$(\theta,\mathbb{M})\text{-BWCM}: p(y=k \mid S \in \mathcal{S}^n_{++}) \propto \exp\left[\langle \lfloor K\rfloor - \lfloor L_k\rfloor, \lfloor A_k\rfloor\rangle + \frac{1}{4\theta}\langle \mathbb{K}^{\frac{\theta}{2}} - \mathbb{L}_k^{\frac{\theta}{2}}, \mathbb{M}^{-1}\mathbb{A}_k\rangle\right], \tag{15}$$

where $S = KK^{\top}$ and $P_k = L_kL_k^{\top}$ are Cholesky decompositions. The parameters are $P_k \in \mathcal{S}^n_{++}$ and $A_k \in \mathcal{L}^n$ for each class $k = 1,\cdots,C$.

Residual blocks

$$x^{(i)} = \mathrm{Exp}_{x^{(i-1)}}\left(\ell_i(x^{(i-1)})\right), \text{ where } \ell_i : \mathcal{M} \to T\mathcal{M}$$
$$Y = \mathrm{Exp}_X\left(Q\,\mathrm{diag}\left(f(\mathrm{spec}(X))\right)Q^T\right),$$

Experiments

Effectiveness

Table 2: SPD MLRs under different metrics on the SPDNet backbone. The best two results are highlighted in **red** and **blue**.
